

Version 1

Feature 2: Reminder for taking the patient's prescription

When the administrator presses the “Recipes” button, “RecipesView” is displayed initialized with the list of recipes (from the database) in the form of a list of cards.

A card contains the full name of the patient, the name of the recipe and the number of days until the prescription expires, which is framed in a square, within the card and is colored red, green or orange.

These change depending on the number of days. When there are 0-7 days left it is red, 7-14 days is orange, 14-.... is green. Every time the “RecipesView” is accessed, the application will recalculate and the color of the square within the card if the date changed. The administrator can scroll up and down to see all the cards in the list.

To confirm the extent of the recipe, the administrator would have to click on the recipe to access “MoreDetailsRecipe” view and then press the “actualizeaza” button. Just the recipes with red status and 0 days left will have that button showed. After the admin pressed that button the “RecipesView” will be showed with the extended recipe.

If the administrator forgets to log in to the application to mark the card and it has expired, the application will send a push notification that the card has expired and must be marked and will include it in the report generated every day.

If the administrator clicks on the notification, the expired recipe will be displayed, i.e. the “MoreDetailsRecipe” view.

The list of recipes is ordered by the status (red status recipes are first, then orange and then green).

After pressing the save button, the updated “RecipesView” with the reset card will be displayed (placed aprox. at the end of the list – it also depends on the other recipes). The reset is done as follows: The last date entered and the duration of the recipe are read from the database. They are converted into milliseconds compared to 01 January 1970. The last date entered and the duration of the recipe are added together to obtain the reference date for when the recipe must be retrieved again. That date is stored. The last date is subtracted from the next reference date and the difference is obtained which is then converted into days to be displayed on the screen. (e.g. 07.07.2025 + 30 days = 06.08.2025, and the screen will display 30 days, then 29... the difference between the two)

“RecipesView” also contains a “+” button which, when clicked, displays the “AddNewRecipe” window. The window contains: a combo box to select the patient, a

combo box to select the doctor, a date picker widget to choose the initial date of prescription, a combo box to select the duration of the prescription (30 days/60 days/90 days), a save button and a cancel button. By clicking the save button, the new prescription is saved in the database and “RecipesView” is displayed updated with the new card inserted. The prescription date of the prescription is checked to avoid accidentally choosing a wrong year or a year before or after. If the wrong choice is made, a browser alert is displayed to the user. The save button is disabled until all fields are filled in.

Initially, when there are no recipes at all, the message “there are no saved recipes. Enter recipes” will be displayed. And if there are no recipes that have a red/orange/green status. The message “There are currently no recipes with status X” will be displayed.

If you click on a card, the “MoreDetailsRecipe” view is displayed with the card content on the entire screen. The window contains the patient’s full name, the type of recipe, the doctor, the date of the last prescription prescribed by the doctor, the duration of the prescription and a list of the dates of previous prescriptions by the doctor, just like a card. The card contains the date and name of the recipe. The administrator can scroll through the list of days.

The “MoreDetailsRecipe” view also contains the buttons “Edit recipe” and “Delete recipe”.

If the administrator clicks on the “Edit recipe” button, the “EditRecipe” view is displayed, which contains: the patient’s name, the doctor’s specialization, a preselected combo box with the old doctor, a preselected date widget to choose another last date in case the last date was wrong, a cancel button and a “save changes” button. When the ‘save changes’ button is clicked, the changes are saved in the database. The “save changes” button will remain disabled until at least one field is filled in.

To return to “RecipesView”, from the “MoreRecipeDetails” window, the administrator will click the back button, located in the down left part of the window.

If the administrator clicks on the “Delete recipe” button, a pop-up window will be displayed to confirm the deletion of the recipe. The window contains a text, a cancel button and a Delete button. If the administrator clicks on Yes, the recipe will be permanently deleted, along with all the data. After clicking on the Yes button, the user returns to “RecipesView”, which will no longer contain the respective card.

In the search box, the administrator can write the patient’s or doctor’s name and for each letter, the database will be search patients with that name. Then the RecipesView page will be refreshed with only those cards.

The RecipesView window also contains a filter button, next to the other filter button, which has 4 statuses: Gray, Red, Orange and Green. Gray – displays all cards, regardless of status

Red – only those with red status The same for the orange and green ones.

By pressing the button, its color and text change, depending on the status. Depending on the status of the button, the list will also be filtered. If the button has a red status, then only the recipes in the list that have a red status will be displayed.

Data I save:

Patient full name, doctor specialization, prescription status, doctor full name, prescription duration, prescription prescription date,

For the database, maybe an idea would be a Recipes table with the following columns:

patient_fullname (MARIA TANASE), doctor_specialization (neurologist/psychiatrist),
doctor_fullname (ALBERT POPESCU), recipe_duration (30 days/60 days/90 days),
recipe_prescription_date_latest_date (09/07/2025), recipe_dates_list ([09/07/2025,
08/06/2025, 09/05/2025...])
